## CoSoSys releases new version of Endpoint Protector 4

CoSoSys, a provider of cross-platform data loss prevention, device control and mobile device management tools, has released an update for its Endpoint Protector 4 platform. Endpoint Protect v.4.4.0.3 aims to provide IT administrators with improved content-aware protection policies in respects to management as well as reporting. The new version includes enhancements for the mobile device management module that allows for more advanced actions, to better secure mobile devices across multiple operating systems, which includes OS X, iOS and Android.

IT administrators can create filters for data being shared and uploaded on the cloud or transferred by Outlook or Skype, and its Regular Expressions feature -- which allows IT administrators to define patterns for filtering criteria -- has also been added as part of the content-aware protection suite. Pricing is dependent upon the number of devices.
